

# Package ‘MIMP’

May 17, 2014

**Type** Package

**Title** Predicting the impact of single nucleotide variants on kinase-substrate phosphorylation

**Version** 1.0

**Date** 2013-10-29

**Author** Omar Wagih

**Maintainer** Omar Wagih <wagih@ebi.ac.uk>

**Description** No description

**License** LGPL

## R topics documented:

<b>Index</b>	<b>11</b>

---

bestSequence	<i>Given a position weight matrix, find the best matching sequence</i>
--------------	--

---

**Description**

Finds the amino acid at each position of the PWM with the highest occurrence. Used in matrix similarity score calculation.

**Usage**

```
bestSequence(pwm)
```

**Arguments**

pwm	Position weight matrix
-----	------------------------

**Examples**

```
# No Examples
```

---

dohtml	<i>Helper function for results2html</i>
--------	---

---

**Description**

Helper function for results2html

**Usage**

```
dohtml(x, LOGO_DIR)
```

**Arguments**

x	Data frame resulting from mimp call.
LOGO_DIR	Directory containing sequence logo images.

---

extractDigits	<i>Extracts digits from a string and returns them in a numerical form</i>
---------------	---

---

**Description**

Extracts digits from a string and returns them in a numerical form

**Usage**

```
extractDigits(string)
```

**Arguments**

string	String to be manipulated
--------	--------------------------

**Examples**

```
extractDigits(A123F)
```

---

flankingSequence	<i>Get flanking sequences of a position.</i>
------------------	--

---

**Description**

This function obtains the flanking sequence at one or more position. Out of bound indices are replaced by a blank character.

**Usage**

```
flankingSequence(seqs, inds, flank = 7, empty.char = "-")
```

**Arguments**

seqs	Character vector of sequences. If only one sequence is provided, indices from inds are assumed to all be from the same sequence.
inds	Numerical vector of positions corresponding to the sequences provided in seqs.
flank	Value indicating the number of characters to extract, before and after an index
empty.char	Character used to replace out of bound flanking sequences

**Examples**

```
# One sequence and one index. Central character is B
flankingSequence(seqs=ABC, inds=2, flank=1)
# An example showing the use of empty.char
flankingSequence(seqs=ABC, inds=2, flank=5)
# An example with multiple sequences and indices
flankingSequence(seqs=c(ABC, XYZ), inds=c(2, 1), flank=1)
```

mimp

*Predict the impact of single variants on phosphorylation.***Description**

This function takes in mutation, sequence and phosphorylation data to predict the impact the mutation has on phosphorylation.

**Usage**

```
mimp(muts, seqs, psites, perc.bg = 90, perc.fg = 10, thresh.log2 = 0,
      display.results = T)
```

**Arguments**

**muts** Mutation data file: a space delimited text file or data frame containing two columns (1) gene and (1) mutation. Example:

```
TP53      R282W
CTNNB1    S33C
CTNNB1    S37F
```

**seqs** Sequence data file containing protein sequences in FASTA format OR named list of sequences where each list element is the uppercase sequence and the name of each element is that of the protein. Example: list(TP53="ABCXYZ", CDK2="HJKEWR")

**psites** Phosphorylation data file (optional): a space delimited text file containing positions of phosphorylation sites. Example:

```
TP53      280
CTNNB1    29
CTNNB1    44
```

**perc.bg** Percentile value between 0 - 100. This value is used to compute a threshold,  $\langle ce \rangle \langle b2 \rangle$  from the negative (background) distribution of scores. By default this is the 90th percentile of the background distribution of scores. Anything below the threshold is considered a negative hit.

**perc.fg** Percentile value between 0 - 100. This value is used to compute a threshold,  $\langle ce \rangle \langle b1 \rangle$  from the positive (foreground) distribution of scores. By default this is the 10th percentile of the foreground distribution of scores. Anything above the threshold is considered a positive hit.

**thresh.log2** Threshold for the absolute value of log ratio. Anything less than this value is discarded (default: 0).

**Value**

The data is returned in a `data.frame` with the following columns:

**gene** gene with the rewiring event

mut	mutation causing the rewiring event
psite_pos	position of the central residue of the phosphosite
mut_dist	distance of the mutation from the central phosphosite
wt	sequence of the wildtype phosphosite (before the mutation)
mt	sequence of the mutated phosphosite (after the mutation)
score_wt	matrix similarity score of the wildtype phosphosite
score_mt	matrix similarity score of the mutated phosphosite
log_ratio	Log2 ratio between mutant and wildtype scores. A high positive log ratio represents a high confidence gain-of-signaling event. A high negative log ratio represents a high confidence loss-of-signaling event.
pwm	name of the kinase being rewired
perc_wt	Percentile rank of the wt score
perc_mt	Percentile rank of the mutant score

### Examples

```
# Get the path to example mutation data
mut.file = system.file("extdata", "mutation_data.txt", package = "MIMP")

# Get the path to example FASTA sequence data
seq.file = system.file("extdata", "sequence_data.txt", package = "MIMP")

# View the files in a text editor
browseURL(mut.file)
browseURL(seq.file)

# Run rewiring analysis
results = mimp(mut.file, seq.file, display.results=TRUE)

# Show head of results
head(results)
```

mss

*Compute matrix similarity score as described in MATCH algorithm*

### Description

Computes matrix similarity score of a PWM with a k-mer. Score ranges from 0-1, as described in [PMID: 12824369]

### Usage

```
mss(seqs, pwm, is.kinase.pwm = T, na.rm = F, ignore.ind = 8)
```

### Arguments

seqs	Sequences to be scored
pwm	Position weight matrix
is.kinase.pwm	TRUE if PWM is that of a kinase
na.rm	Remove NA scores?

**Examples**

```
# No Examples
```

---

pSNVs	<i>Find phosphorylation related variants (pSNVs)</i>
-------	--

---

**Description**

Given mutation data and psites, find variants that exist in the flanking regions of the psite

**Usage**

```
pSNVs(muts, psites, seqs, flank = 7, multicore = F)
```

**Arguments**

muts	Mutation data as data frame of two columns (1) name of gene or protein (2) mutation in the format X123Y, where X is the reference amino acid and Y is the alternative amino acid.
psites	Phosphorylation data as a data frame of two columns (1) name of gene or protein (2) Position of the phosphorylated residue
seqs	Sequence data as a name list. Names of the list correspond to the gene or protein name. Each entry contains the collapsed sequence.
flank	Number of amino acids flanking the psite to be considered
multicore	If true, will use mclapply to speed things up!

**Examples**

```
# No examples
```

---

PWM	<i>Construct position weight matrix</i>
-----	---

---

**Description**

Makes a position weight matrix given aligned sequences.

**Usage**

```
PWM(seqs, pseudocount = 0.001, relative.freq = T, type = "AA",
     priors = AA_PRIORS_HUMAN)
```

**Arguments**

seqs	Aligned sequences all of the same length
pseudocount	Pseudocount factor. Final pseudocount is background probability * this factor
relative.freq	TRUE if each column should be divided by the sum
type	Type of sequences 'AA' or 'DNA'
priors	Named character vector containing priors of amino acids.

**Examples**

```
# No examples
```

---

replaceChar	<i>Replace characters at certain positions of a string with another character.</i>
-------------	--

---

**Description**

Replace characters at certain positions of a string with another character.

**Usage**

```
replaceChar(string, pos, char)
```

**Arguments**

string	String to be manipulated
pos	One or more positions corresponding to characters to be changed
char	Replacement character

**Examples**

```
replaceChar(ABC, 2, X)
```

---

results2html	<i>Display MIMP results interactively in browser</i>
--------------	--

---

**Description**

Display MIMP results interactively in browser

**Usage**

```
results2html(x, max.rows = 5000)
```

**Arguments**

x	Data frame resulting from mimp call.
max.rows	If data contains more rows than this value, results won't be displayed.

---

saveTransfac	<i>Save a PWM matrix object to transfac format</i>
--------------	--

---

### Description

This saves an already generated PWM matrix object in R to transfac format, which can be read in by RWebLogo

### Usage

```
saveTransfac(pwm, file.out = tempfile("transfac"), type = "aa")
```

### Arguments

pwm	PWM matrix object
file.out	where the transfac matrix is written
type	'aa', 'dna' or 'rna' depending on the namespace

---

scoreArray	<i>Get weight/probability for each amino acid in a sequence</i>
------------	---

---

### Description

Gets weight/probability for the amino acid at each position of the sequence as an array.

### Usage

```
scoreArray(seqs, pwm)
```

### Arguments

seqs	One or more sequences to be processed
pwm	Position weight matrix

### Examples

```
# No Examples
```

---

scoreWtMt	<i>Score wt and mt sequences for a pwm</i>
-----------	--

---

### Description

Score wt and mt sequences for a pwm

### Usage

```
scoreWtMt(pwm, mut_ps, is.kinase.pwm = T, thresh.bg = 1, thresh.fg = 0,
  thresh.log2 = 0)
```

### Arguments

pwm	Position weight matrix of interest
mut_ps	psnvs data frame containing wt and mt sequences computed from pSNVs function
is.kinase.pwm	TRUE if pwm is that of a kinase
thresh.bg	Anything below this threshold is considered a negative hit
thresh.fg	Anything above this threshold is considered a positive hit
thresh.log2	Threshold for the absolute value of log ratio. Anything less than this value is discarded.

---

unfactor	<i>Converts all columns of a data frame of class factor to character</i>
----------	--

---

### Description

Converts all columns of a data frame of class factor to character

### Usage

```
unfactor(df)
```

### Arguments

string	String to be manipulated
--------	--------------------------

### Examples

```
unfactor( data.frame(x=c(A, B)) )
```

---

`worstSequence`*Given a position weight matrix, find the worst matching sequence*

---

**Description**

Finds the amino acid at each position of the PWM with the lowest occurrence. Used in matrix similarity score calculation.

**Usage**

```
worstSequence(pwm)
```

**Arguments**

<code>pwm</code>	Position weight matrix
------------------	------------------------

**Examples**

```
# No Examples
```
